

Abstract

A car cup holder dispensing box has a hexagonal shape with a dispensing closure including a precision stopping mechanism and is all made of one sheet of paper stock. The dispensing opening may be in the top or in one side of the box. The slider may have stops to limit its movement, and may be guided by the box construction. The slider may be attached to an actuation panel extending down one side of the box, and the actuation panel may also serve as a handle for removing the box from the cup holder receptacle, and for handling the box.
